Problem Statement

A library management system is utilized to trace book transactions, which include book check-ins and check-outs, and current inventory. The current system keeps track of everything through physical media (e.g., pen and paper), which has resulted in inefficient check-ins and check-outs, librarians failing to keep locating and updating information due to lost paperwork and other acts of human error, and user inconvenience.

To rectify this issue, a digital library management system will provide an opportunity to make library operations more effective by reducing manual errors and improving the user experience. By automating how librarians manage the book database and the process of borrowing and returning books, employee physical workload will be reduced, and users will be able to locate books in real time and therefore increase system efficiency.

System Requirements:

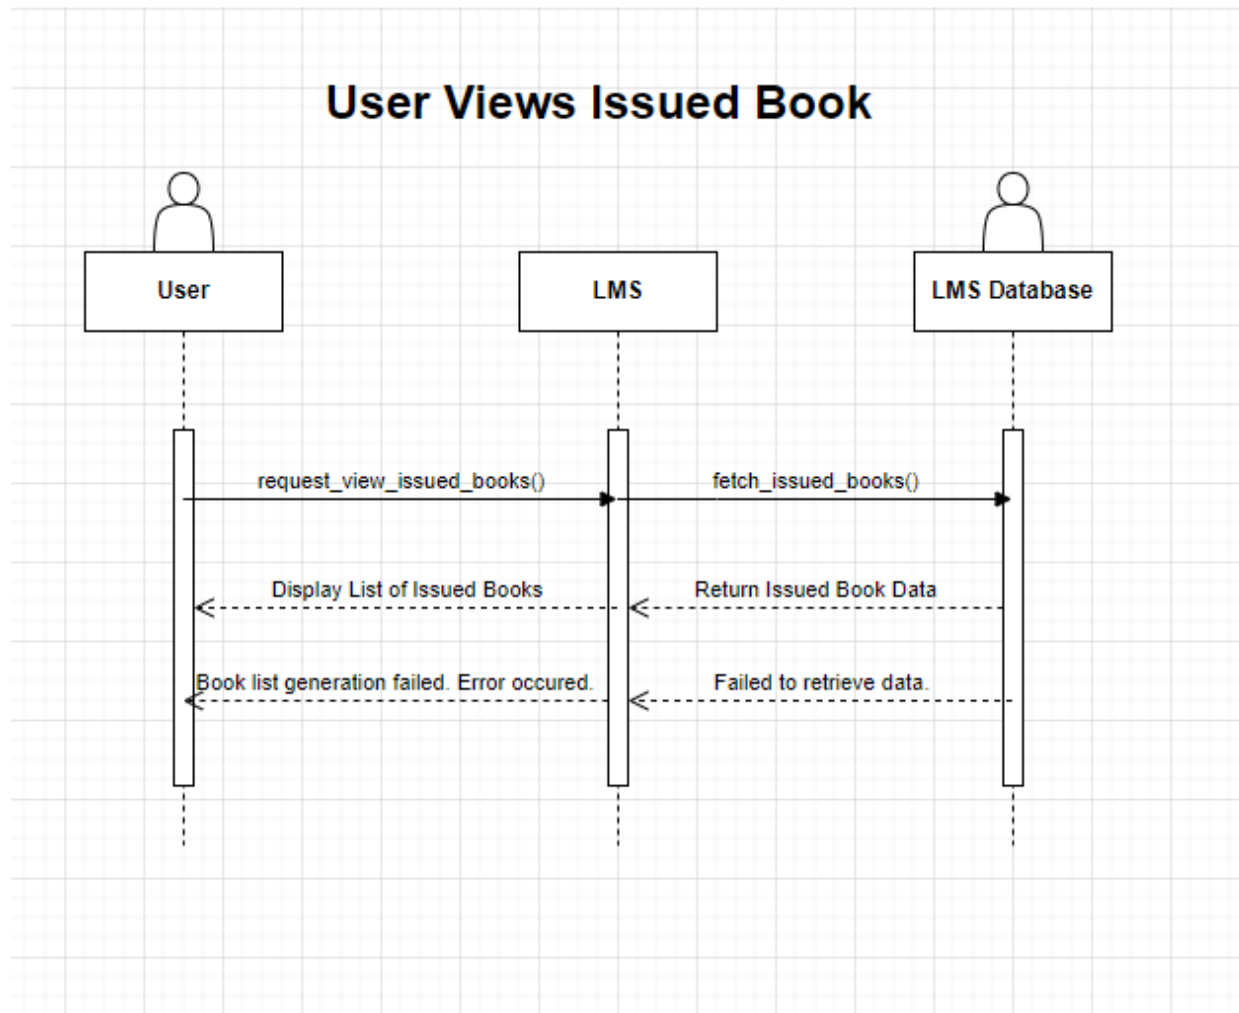

- Software
 - Operating System
 - Windows OS
 - Back-end
 - PHP
 - MySQL
 - Front-end
 - HTML
 - Framework
 - Bootstrap

- Hardware
 - Standard desktop for librarians and users
- Server Requirements
 - CPU: Quad-Core Processor (Intel or AMD)
 - RAM: 16 GB
 - Storage: 500 GB SSD (expandable)
- Network
 - 1 Gbps LAN Connection
 - Wi-Fi Access for staff and users
 - WP2 or WP3 Recommended

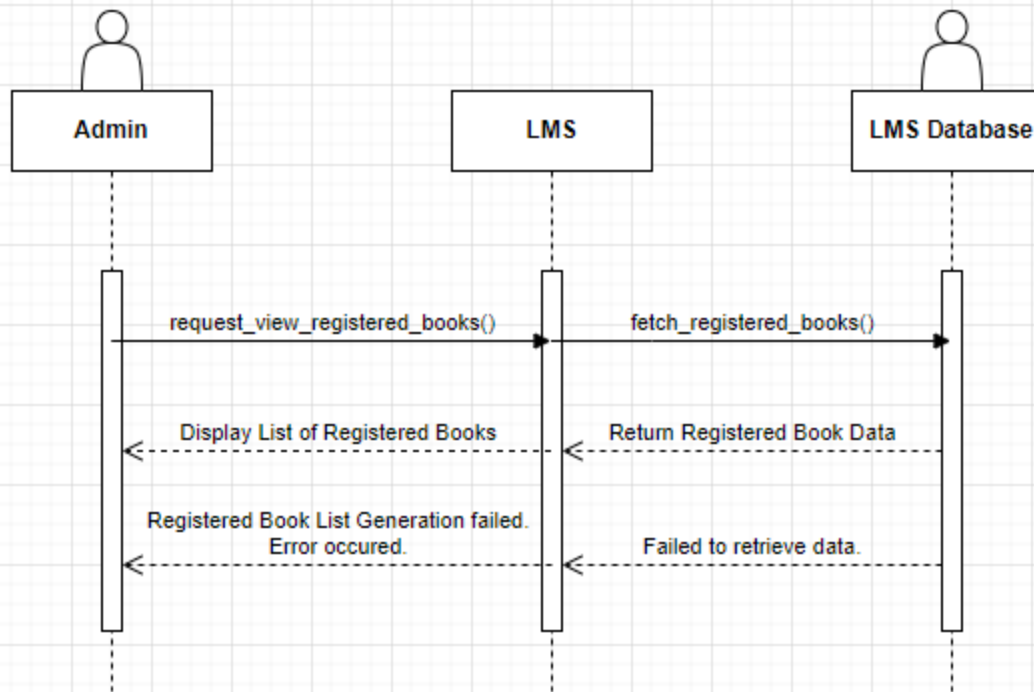

Functional Requirements Specification

Requirement	Description	Priority
User Registration	Users should be able to sign up with a unique email and password.	High
User Login	Users should be able to log in with valid credentials.	High
Password Reset	Users should be able to change/reset passwords securely.	Medium
Admin Authentication	Admins should have separate login credentials with higher privileges.	High
View Profile	Users should be able to view their personal information.	High
Edit Profile	Users should be able to update their details.	Medium
Admin User Management	Admins should be able to view, update, and delete user accounts.	High
Add Books	Admins should be able to add books with relevant details.	High
Update Books	Admins should be able to update book details.	High
Delete Books	Admins should be able to remove books.	Medium
View Books	Users should be able to browse all available books.	High
Search Books	Users should be able to search for books by title, author, or category.	High
Add Authors	Admins should be able to add new authors.	Medium
Edit Authors	Admins should be able to update the author's details.	Low
Add Book Categories	Admins should be able to create and manage book categories.	Medium
Issue Books to Students	Admins should be able to assign books to students.	High
Track Issued Books	Maintain a record of issued books, including issue date.	High
Return Books	Admins should be able to mark books as returned.	High
Check Book Availability	Users should be able to check if a book is available.	Medium
User View	Users should be able to see the books they have borrowed.	High
Admin View	Admins should be able to see all the books issued and the students who borrowed them.	High
Overdue Notifications	Notify users and admins if a book is overdue.	Medium
Issuance/Return Notifications	Users should receive confirmations on book transactions.	Low
Manual Logout	Users should be able to log out securely.	High
Access Control	Regular users should not be able to access admin features.	High

Project Plan

Most of the functionalities have been completed, but I still need to implement critical features into the program, such as editing and deleting authors, and a way to change passwords and edit user and admin details. Additionally, there are a lot of bugs in this program that need to be rectified as demonstrated in the demo. The technological stack has been finalized to match the scope of the project and my current capabilities. I was originally going to use Python for this project, but I realized it was outside of my expertise. While I am familiar with PHP, I'm not an expert at it so figuring out errors took longer than usual. That said, I will complete as much as I can before the final implementation.

- Week 9 – Implement author management and clean bugs.
 - Improve security features
- Week 10 – Clean up the UI/UX Design
- Week 11 – Have editing user details and change password features complete.
 - Have input and form validation.
- Week 12 – Work on notification feature.
- Week 13 – Pretty up the CSS
- Week 14 – Double check for bugs
- Week 15/16 – Prepare for final presentation.

References

I used this tutorial to help me understand the scope of the project, but the tutorial itself was incomplete. I had to determine bugs and errors for the rest of the project, as well as Sprucing the UI design to match my tastes. The tutorial used a previous version of Bootstrap, so I had to update the code to match Bootstrap 5.

Highlighted Changes

I did not receive feedback on any of the diagrams and project proposals at the time of submission, so I cannot highlight any changes in the proposal and project.
